

# Class 5: Data Viz with ggplot

Jeffrey (PID: A16776318)

## Table of contents

<b>Background</b>	<b>1</b>
Using different aes and geoms . . . . .	5
Gene expression plot . . . . .	7
Custom Color Plot . . . . .	8
<b>Using different geoms</b>	<b>9</b>

## Background

There are many graphic systems available in R. These include “base” R and tones of add on packages like **ggplot2**.

Let’s compare “base” and **ggplot2** briefly. We can use some example data that is built-in with R called `cars`:

```
head(cars)
```

```
  speed dist
1     4    2
2     4   10
3     7    4
4     7   22
5     8   16
6     9   10
```

In base R I can just call `plot()`

```
plot(cars)
```

How can we do this with **ggplot2**

First we need to install the package. We can do this `install.packages("ggplot2")`. I only need to do this once then it will be available on my computer from then on.

Key point: I only install packages in the R console not within quarto docs or R scripts.

Before I use any add-on package I must load it up with a call to `library()`

```
library(ggplot2)
ggplot(cars)
```

```
ggplot(cars)
```

Every ggplot has or need at least 3 things/layers:

- **data** (in our case `cars`)
- **aesthetics** (how the data map to the plot)
- **geometry** (geom) that determine how the map is drawn (lines, points, columns, etc.)

```
ggplot(cars) +  
  aes(x=speed, y=dist)
```

```
ggplot(cars) +  
  aes(x=speed, y=dist) +  
  geom_point()
```

For “simple” plots ggplot is much more verbose than base R but the defaults are nicer and for complicated plots it has become more efficient and structured.

## Using different aes and geoms

Question: How to add a line to show the relationship of speed to stopping distance.  
(i.e. add another “layer”)?

```
p <- ggplot(cars) +
  aes(x=speed, y=dist) +
  geom_point() +
  geom_smooth(se=FALSE, method="lm")
```

fn + f1 on commands to see help commands. `geom_smooth(se=FALSE)` removes the StDev area I can always save any ggplot object (i.e. plot) and use it later for adding more layers

p

```
`geom_smooth()` using formula = 'y ~ x'
```

Question: How to add a title and subtitle to the plot? - Hint: Use ChatGPT when you need help to search up commands

```
p + labs(title="My first ggplot",  
         subtitle = "Stopping distance of old cars",  
         caption = "BIMM143",  
         x="Speed (MPG)",  
         y="Stopping distance (ft)") +  
theme_bw()
```

``geom_smooth()`` using formula = 'y ~ x'

## My first ggplot

Stopping distance of old cars

BIMM143

## Gene expression plot

Read input data into R

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

Question: How many genes are in this dataset?

```
nrow(genes)
```

```
[1] 5196
```

Question: How many columns are there?

```
ncol(genes)
```

```
[1] 4
```

Question: What are the column names?

```
colnames(genes)
```

```
[1] "Gene"          "Condition1" "Condition2" "State"
```

Question: How many “up” and “down” regulated genes are there?

Using different aes and geoms

```
table(genes$State)
```

down	unchanging	up
72	4997	127

## Custom Color Plot

Question: Make a first plot of this data

```
ggplot(genes) +  
  aes(x=Condition1, y=Condition2, col=State) +  
  scale_color_manual( values=c("red","burlywood4","yellow")) +  
  geom_point() +  
  labs(title="Gene expression changes upon drug treatment",  
        x="Control (no drug)",  
        y="Drug treated")+  
  theme_bw()
```

## Gene expression changes upon drug treatment

## Using different geoms

Let's plot some aspects of the in-built `mtcars` dataset.

```
head(mtcars)
```

	mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear	carb
Mazda RX4	21.0	6	160	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

Question: Scatter plot of `mpg` vs `disp`

```
p1 <-ggplot(mtcars, aes(x = disp, y = mpg)) +
  geom_point(color = "blue") +
  labs(title = "MPG vs Displacement", x = "Displacement", y = "MPG")
```

Question: boxplot of `gear` vs `disp`

```
p2<-ggplot(mtcars) +  
  aes(gear, disp, group=gear) +  
  geom_boxplot()
```

Question: barplot of carb

```
p3<-ggplot(mtcars) +  
  aes(carb) +  
  geom_bar()
```

Smooth of disp vs qsec

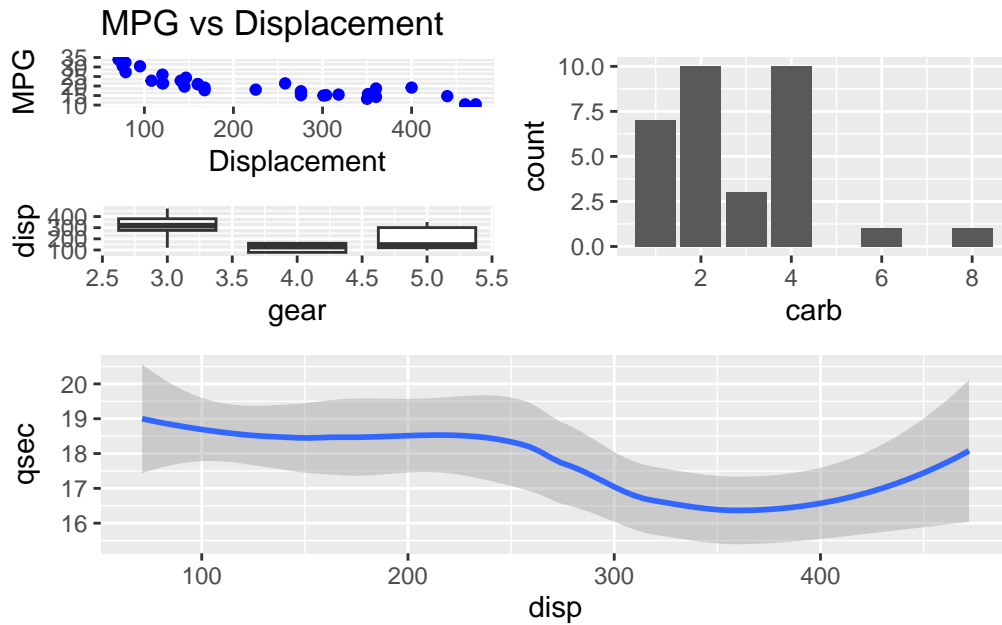

```
p4<-ggplot(mtcars) +  
  aes(disp, qsec)+  
  geom_smooth()
```

I want to combine all these plots into one figure with multiple plannels.

We can use the **patchwork** package to do this

```
library(patchwork)  
  
( (p1 / p2 | p3) / p4)
```

`geom\_smooth()` using method = 'loess' and formula = 'y ~ x'

```
ggsave(filename="myplot.png", width=10, height=10)
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```

```
## Faceting
```

```
# File location online
```

```
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.tsv"
```

```
gapminder <- read.delim(url)
```

```
head(gapminder)
```

	country	continent	year	lifeExp	pop	gdpPercap
1	Afghanistan	Asia	1952	28.801	8425333	779.4453
2	Afghanistan	Asia	1957	30.332	9240934	820.8530
3	Afghanistan	Asia	1962	31.997	10267083	853.1007
4	Afghanistan	Asia	1967	34.020	11537966	836.1971
5	Afghanistan	Asia	1972	36.088	13079460	739.9811
6	Afghanistan	Asia	1977	38.438	14880372	786.1134

Question: How many countries are in this dataset?

```
length(table(gapminder$country))
```

```
[1] 142
```

Question: Plot gdpPercap vs lifeExp color by continent

```
ggplot(gapminder) +  
  aes(x=gdpPercap, y=lifeExp, col=continent) +  
  geom_point(alpha=0.3) +  
  facet_wrap(~continent) +  
  theme_bw()
```
